

TROUBLESHOOTING GERANIUMS

Geraniums exhibit a high sensitivity to ethylene which causes them to yellow during shipping. When geraniums are in the box for an extended period of time or experience higher temperatures, you may unpack a tray of geraniums with yellowing as shown to the right.

Over the years, MYP's Growing Department has received questions from customers about what they should do.

Because of this, we worked with one specific customer by asking them to plant the geraniums and take pictures as they progressed and now we have a tool to share with you, our customer.

Check out this customers geranium progression from yellow geraniums upon receipt to a successful finished crop.

Geraniums at receiving.

10 days from receiving.

32 days from receiving.

Finished crop.

50 days from receiving.

For best results, plant geraniums immediately, put in high light with a temperature of 68-72°, and feed 100 ppm constant until establishment. Then increase the feed to push for desired growth (150-200 ppm).
